Hence classic, classify, etc.*] 1. In *anc. hist.*, one of the five divisions of the Roman citizens made, according to their wealth, by Servius Tullius, for purposes of taxation: a sixth division comprised those whose possessions fell below the minimum of the census. Hence—2. An order or rank of persons; a number of persons having certain characteristics in common, as equality in rank, intellectual influence, education, property, occupation, habits of life, etc.

We are by our occupations, education, and habits of life divided almost into different species. Each of these *classes* of the human race has desires, fears, and conversation, vexations and merriment peculiar to itself. *Johnson*.

Nine tenths of the whole people belong to the laborious, industrious, and productive *classes*.
D. Webster, Speech, Pittsburg, July, 1833.

3. Any body of persons grouped together by particular circumstances or for particular reasons. Specifically—(a) A number of pupils in a school, or of students in a college, of the same grade or pursuing the same studies; especially, in American colleges, the students collectively who are graduated, or in accordance with the rules of the college will be graduated, in the same year. There are four college classes, the freshman or lowest, the sophomore, the junior, and the senior. The word was first used in this sense in American colleges in the Latin form *classis*, and was borrowed from the universities of continental Europe, where it had during the sixteenth century replaced the medieval *lectio*. (b) In the *Meth. Ch.*, one of several small companies, usually numbering about twelve members, into which each society is divided, for more effective pastoral oversight, social meeting for religious purposes, and the raising of money for church work. It ordinarily holds a weekly session called a *class-meeting*, under the charge of one of the members called a *class-leader*, whose duty it is to see every member of his class at least once a week; to give religious instruction, reproof, or comfort, as needed; to receive for the stewards of the church the contributions of the class for the support of the church; to report to the pastor any members needing special attention, as the sick, backsliders, etc.; and to report on the condition of his class to each Quarterly Conference. (c) Same as *classis*, 2. (d) In several European states, one of the graded divisions of primary electors for members of the legislative body. In Prussia the whole number of voters is divided into three classes, so arranged that each class pays one third of the direct tax levied. The first class is of the few wealthy, who pay the highest taxes, to the amount of one third of the whole. Each class chooses the same number of secondary electors, who elect the deputies.

4. A number of objects distinguished by common characters from all others, and regarded as a collective unit or group; a collection capable of a general definition; a kind. A *natural class* is a set of objects possessing important characters over and above those that are necessary for distinguishing them from others; but the term is applied by naturalists to groups which want this character, and which have not generally retained very long, unchanged, a place in science. See *classification*.

There is not a more singular character in the world than that of a thinking man. It is not merely having a succession of ideas which lightly skim over the mind that can with any propriety be styled by that denomination. It is observing them separately and distinctly, and ranging them under their respective *classes*.
Melmoth, Letters of Fitzosborne.

Logicians divide propositions into certain *classes*.
Reid, Account of Aristotle, ii. § 1.

Observing many individuals to agree in certain attributes, we refer them all to one *class*, and give a name to the *class*.
Reid, Intellectual Powers, v. § 2.

[This meaning came into use about the middle of the eighteenth century. The phrase 'to be included under a class' is older than 'to be included in a class.']

5. In *nat. hist.*, a group of plants or animals next in rank above the order or superorder, and commonly formed by the union of several orders or superorders; but it may be represented by a single species. See *classification*. In zoology the class was the highest division of the animal kingdom in the Linnean system, when the word first acquired its technical zoological meaning. Linneus arranged animals in six classes: *Mammalia, Aves, Amphibia, Peces, Insecta, Vermes*; the next group below

were the orders. In the Cuvierian system a class was the first division of one of the four "great divisions" of the animal kingdom, *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata*; thus Cuvier's four classes of *Vertebrata* were *Mammalia*, *Aves*, *Reptilia*, and *Pisces*. There are now recognized seven or eight subkingdoms or phyla of animals, divided into about thirty-five classes (see *animal kingdom*, under *animal*); the class being the division usually recognized next below the phylum or subkingdom, though some naturalists introduce a *superclass*, or division between the phylum and the class, as *Ichthyopsida* for the classes *Pisces* and *Amphibia*, or *Sauropsida* for the classes *Aves* and *Reptilia*. The class is always superior to the superorder, order, or suborder, and inferior to the kingdom, subkingdom, or phylum. In botany, likewise, the class is the next principal grade of divisions above the order, and in the Linnean system was the highest grade. The subclass, division, and cohort or alliance are, however, often variously intercalated as subordinate groupings between the class and the order. The phœnogramic series or subkingdom of plants includes the three classes of *gymnosperms* (often united with the next), *dicotyledons*, and *monocotyledons*. The cryptogamic series has been ordinarily divided into the two classes of *acrogens* and *thallogens*; by recent authorities the number has been increased by three or four or more.

6. In *geom.*, the degree of a locus of planes; a division of algebraical loci bearing an ordinal number showing how many planes there are incident to the locus and passing through each line of space. In the case of a plane locus, this is the number of lines in the plane incident to the locus and passing through each point in the plane. The ordinal number of the class of an algebraical surface is the number of tangent planes to the surface through each line of space. The class of an algebraical curve of double curvature is the number of osculating planes through each point of space; also, the class of a cone on which the curve lies. The class of an algebraical plane curve is the number of tangents through each point of the plane. The class of a congruence is the number of lines of the congruence passing through each point of space. The class of a complex is the class of the cone of lines of the complex passing through each point of space. The class of a cone is the class of a plane curve lying in it.—**Class cup**, a silver cup presented by a college class to the first boy born to a member of the class after graduation. [U. S.]—**Class of a manifold**. See *manifold*.

H. Spencer, *Man vs. State*, p. 5.

2. To place in ranks or divisions, as students that are pursuing the same studies; form into a class or classes, as in an educational institution. = **Syn.** 1. *Class*, *Classify*; arrange, distribute, dispose. *Class* is the older and less precise word; it is applied to persons more often than *classify*. *Classify* is used in science rather than *class*, as being more exact.

A *classic* is properly a book which maintains itself by virtue of that happy coesence of matter and style, that innate and requisite sympathy between the thought that gives life and the form that consents to every mood of grace and dignity, . . . and which is something neither ancient nor modern, always new and incapable of growing old.

Lovell, *Among my Books*, 2d ser., p. 126.

The present practice of making the *classics* of a language the vehicle of elementary grammatical instruction cannot be too strongly condemned. classification (klās'i-fi-kā'shon), *n.* [= G. *klassifikation* = D. *Klassifikation* = Dan. *Klassifikation* = F. *classification* = Sp. *clasificación* = Pg. *classificação* = It. *classificazione*, < NL. *classificatio(n)*, < *classificare*, classify: see *classify*.] The act of forming a class or of dividing into classes; the act of grouping together those beings or things which have certain characters in common; distribution into sets, sorts, or ranks; taxonomy.

In natural history classification has been made on two principles, distinguished as the *natural* and the *artificial*: the former aiming to arrange all known plants or animals according to their resemblances, and degrees of resemblance, in the whole plan of their structure; the latter arranging them by some one or more points of resemblance or difference, as may be most convenient and easy, and without regard to other considerations. The widest divisions in zoölogy are called subkingdoms; subkingdoms are divided into phyla or classes, classes into orders, orders into families, families into genera, genera into species, and species into varieties. There are also intermediate divisions, as subclass, superorder, suborder, subfamily, etc. In botany the same divisions are used as in zoölogy, except that orders and families are identical, and the term *phylum* is not used. See *animal kingdom*, under *animal*, and *class*, 5.—**Cross-classification**, a classification in which the different classes are subdivided upon a common differentiating principle, so that they are not subordinated to one another. Thus, the division of the population into native and foreign, male and female, is a cross-classification. Such are the classifications of chemistry, geometry, logic, etc. Cross-classification violates a canon of Aristotelian logic.—**Hierarchical classification**, a classification in which the subdivisions of different classes are different, as was required by Aristotle. Such are the usual classifications of botany and zoölogy.—**Quinary** or **quaternary classification**. See *quinary*.

Speaking strictly, we form a class when we bring together a collection of individuals held in union by the bond of one or more points of community, and when we take care that nothing that is destitute of the point or points of community is admitted into the class: we *classify* when we arrange classes thus constructed on the principle of higher and lower; wider and narrower.

Like the pianoforte, it had a keyboard and a set of strings on a horizontal frame; but the tone was produced by the pressure of a brass "tangent" raised and

held against the string, instead of by the stroke of a hammer. This method of tone-production permitted considerable variation in force and in quality. The compass of the clavichord was originally limited to a few notes in diatonic succession, and the advance to a full chromatic scale was made gradually. Tuning in equal temperament was not established until toward the middle of the eighteenth century.

In man and sundry quadrupeds there are complete clavicles or collar-bones, each joined at one end to the scapula or shoulder-bone, and at the other to the sternum or breast-bone. In many quadrupeds the clavicles are absent or rudimentary, while in birds they are united in a single forked piece, popularly called the *merrythought* or *wishbone*. In many vertebrates below birds clavicles are recognized, but their homology is not always clear. The human clavicle is by some considered to be composed of its body, or clavicle proper, with a mesoscapular segment or acromial epiphysis, a preacromial or sternal epiphysis, and an omosternum, or interarticular fibrocartilage; but this view is not generally adopted. I. n. 1. The material resulting from the decomposition and consequent hydration of the feldspathic rocks, especially granite and gneiss, and of the crystalline rocks in general. As thus formed, it almost always contains more or less sand, or siliceous material, mechanically intermixed. After this has been separated, the clay itself is found to consist of a hydrated silicate of alumina, but it is not yet positively made out that there is one definite combination of this kind constituting the essential basis of all the substances to which the name *clay* is applied. All clays contain hygroscopic water, which may be expelled by heating to 212° F.; but they also contain water in chemical combination, and when this is driven off by ignition the clay loses its plasticity, which cannot be restored. Ordinary clay contains more or less lime and other impurities, which render it to a certain extent fusible. The purer varieties are refractory, and are known as *fire-clay* (which see). (See also *pipe-clay*, *china-clay*, *porcelain-clay*, and *kaolinite*.) The plasticity of clay is of great importance, as without this quality it could not be easily worked into the various shapes for which it is used. On what condition it depends has not as yet been clearly made out.

2. Earth in general, especially in the Scriptures, as the material from which, according to the account in Genesis, the body of the first man was formed.

I also am formed out of the *clay*. *Job xxxiii.* 6.
Arr. Are we not brothers?

Bradford clay, in *geol.*, a bluish, slightly calcareous clay of the Oölite, well developed near Bradford in England, and remarkable for the number of apicorinites in it.—**Clay process**, the method of making a stereotype printing-plate from a mold of prepared clay. This clay is a combination of potters' clay, kaolin, powdered soapstone, and plaster of Paris.—**Drawn clay**, clay which is shrunk or decreased in volume by burning.—**Long clay**, clay possessing a high degree of plasticity.—**Oxford clay**, in *geol.*,

a subdivision of the Jurassic series, named from the county in England where it is conspicuous. It is the upper one of two sections into which the Oxfordian is divided, the lower one being the Kelloways rock (Callovian). The Oxford clay crops out in England from Dorsetshire through to Yorkshire. It consists mainly of layers of stiff blue clay, and sometimes attains a thickness of 600 feet.—**Potters' clay**, a clay suitable for making the coarser varieties of pottery, or for being worked by the potter.

II. a. Formed or consisting of clay; characterized by the presence of clay; clayey: as, a clay soil; a clay hovel.—**Clay iron ore**. Same as clay ironstone.—**Clay ironstone**, the ordinary form of iron ore occurring in connection with the coal-measures, especially in England, where this ore is one of great importance. It consists essentially of carbonate of iron more or less mixed with clay and sand, and often has the form of nodular concretionary masses. It contains from 20 to 50 per cent. of metallic iron, according to its purity.—**Clay marl**, a whitish, smooth, chalky clay.—**Clay pigeon**, a saucer of baked clay used as an artificial flying target in trap-shooting.—**Clay rock**, a rock made up of fine argillaceous detrital material, and chiefly that derived from the decomposition of the feldspars; indurated clay; clayey material sufficiently hardened to be incapable of being used as clay without grinding, but not chemically altered or metamorphosed.—**Clay shale**, clay having a thinly laminated structure. It differs from clay slate, or argillaceous schist, in that the latter has undergone more or less metamorphism, and from this cause has become crystalline and schistose in structure.—**Clay slate**, an argillaceous rock characterized by having a alaty or fissile structure. It consists of detrital or fragmental material which has become consolidated into a rock, and has undergone more or less rearrangement of its constituent particles. (See *metamorphism*, and *metamorphic rocks*, under *metamorphic*.) Roofing-slate is the most characteristic form of clay slate. The tendency of this rock to split into thin plates, making it available for roofing, is ordinarily the result of conditions arising after its deposition and consolidation (see *cleavage*, 3); sometimes, however, this structure is that of the original deposit. Clay slate, or argillaceous schist, often passes gradually into mica schist, and appears to be an incipient stage in the formation of that rock.

The water from the clay drives the molasses before it, and soon changes it into a saturated solution of pure sugar by dissolving some of the crystals. (e) In *galvanizing sheet-iron*, the operation of removing oxide from the surface of the plates under treatment by immersing them in muriatic acid. Each bank in turn receives from all the other banks the exchanges they have received drawn on it and which it must pay. The exchanges which a bank takes to the clearing-house are called *creditor exchanges*; and the exchanges which it receives from the other banks represented there are called *debtor exchanges*. If the creditor exchanges of a bank exceed its debtor exchanges, it is a "creditor bank," and must be paid the balance; if the reverse is the case, it is a "debtor bank," and must pay the balance. The balances are paid by the debtor banks to the clearing-house for the creditor banks. The details of clearing, especially as regards the mode of paying the balances, differ somewhat in different clearing-houses. The system originated in London, and has been adopted in many cities. In London there is also a railway clearing-house. See *clearing*, 1 (g).—**Clearing-house certificate**, a certificate of deposit issued by a clearing-house. cleat⁴ (klēt), *n.* [Origin obscure.] In *coal-mining*, the principal set of cleavage-planes by which the coal is divided. Bituminous coal is more or less distinctly stratified—that is, divided by planes parallel to the bedding of the rocks above and beneath it. It is also almost always divided into thin layers by two sets of joint-planes nearly at right angles to each other and to the bedding. Of these two sets one is usually more distinct, and this is called the *cleat*. The surfaces exposed in mining on the line of this cleat, which are in reality joint-planes of the coal, are called *faces* and *backs*. Called in England *board*.

2. In *mineral.*, the property possessed by many crystallized minerals of breaking readily in one or more directions, by which means surfaces more or less smooth are obtained. The cleavage shows the direction in which the force of cohesion is least. (Compare *parting*.) It is defined as *perfect* or *eminent*, *imperfect*, *interrupted*, etc., according to the ease with which the fracture takes place, and the smoothness of the resulting surface; also *cubic*, *octahedral*, *rhomboidal*, *prismatic*, *basal*, etc., according to the direction of the fracture.

3. In *geol.*, the property possessed by certain rocks of being easily split or divided into thin layers. It is chiefly the argillaceous rocks in which cleavage is highly developed, and it seems to be the result of metamorphism combined with pressure. The cleavage of roofing-slate is the best illustration of this structure. (See *clay slate*, under *clay*.) Some rocks split into thin layers as a result of stratification, but this is not what is properly understood by cleavage. Tyndall has shown that wax may have planes of cleavage developed in it by pressure; but the only rocks in which cleavage-planes exist in perfection are those which have also undergone some metamorphism. See *metamorphism*.

4. In *embryol.*, segmentation, specifically of the vitellus: distinctively called *egg-cleavage* or *yolk-cleavage*. See *segmentation*.—**Cleavage-cavity**, in *embryol.*, the cavity segmentarium or hollow of a segmented vitellus or yolk which has become a vesicular morula; the interior of a blastula; the cavity of a blastosphere; a blastocoele or blastoceloma.—**Cleavage-globule, cleavage-cell**, a blastomere (which see).—**Cleavage-mass**, in *embryol.*, any cell resulting from the segmentation of the vitellus or yolk of a germinating ovum-cell; a morula-cell.

clepsydras the hours were measured by the sinking of the surface of the water in the vessel containing it. When water is admitted from the cistern, D, the float rises, and the counterweight descends and turns the spindle, on the end of which is a hand which marks the hours on a dial as in a clock. 2. A cluck-like sound, used in the alphabets of certain languages, especially the Hottentot and neighboring tongues in South Africa. It is made by pressing the tip or edge of the tongue against the roof of the mouth, and withdrawing it by a sucking action. There are different clicks, according as different parts of the tongue are used; and guttural sounds are combined in utterance with them. Also called cluck.

"Suction-stops" are formed . . . by placing the tongue or lips in the position for a stop, and then sucking out the air between the organs which form the stop; they are thus pressed strongly together by the pressure of the air in the mouth, so that when separated a distinct smack is heard. These sounds are common in interjectional speech. . . . In many of the South African languages these suction sounds are those essential elements of speech known as clicks. (This name is somewhat inappropriate; "cluck" would describe the sounds better.)

click-beetle (klik'bê'tl), n. A name given to beetles of the family Elateridae, on account of the ability possessed by most species, when placed on the back, of springing into the air with an audible click.

This singular power depends upon the loose articulation between the prothorax and the mesothorax, and on the presence of a long prosteral spine, which fits into an excavation of the mesothorax. The species are very numerous, and in the imago state feed on vegetables. Most of their larvæ have the same feeding habit, but it has been proved that a few are carnivorous. See Elateridae.

In Rom. antiq., a person who was under the guardianship and protection of another of superior rank and influence, called his patron. The relation of client and patron between a plebeian and a patrician, although at first strictly voluntary, was hereditary, the former bearing the family name of the latter, and performing various services for him and his family both in peace and war, in return for advice and support in respect to private rights and interests. Foreigners in Rome, and even allied or subject states and cities, were often clients of Roman patricians selected by them as patrons. The number of a patrician's clients, as of a baron's vassals in the middle ages, was a gage of his greatness.

Swift.

[As used by the Greeks, the word *κλίμα* denoted properly a slope or an incline, and was applied to mountain-slopes (*κλίματα ὄρων*), but especially to the apparent slope or inclination of the earth toward the pole. Hence the word came gradually to be used as nearly the equivalent of *zone* (but not of the divisions of the earth's surface now so named). A change of "climate" took place, in going north, on arriving at a place where the day was half an hour longer or shorter, according to the season, than at the point from which the start was made. The same was the meaning of the word *climate* as used by the early English navigators (see def. 1). Hence the word *climate* came finally to have the meaning now attached to it.]—**Continental climate.** See *continental climate* (klī'māt), *v. i.* [*climate*, *n.*] To dwell; reside in a particular region. cloak (klōk), *n.* [Until recently also spelled *cloke*, *< ME. cloke, < OF. cloke, cloque, cloche, a cloak (cf. Dan. klokke, an under-petticoat), < ML. cloca, a cloak (so called from its shape), lit. a bell: see clock².*] 1. Properly, a loose outer garment without sleeves, worn by either sex as a protection from the weather: now frequently used, though erroneously, for a sleeved outer wrap worn by women. In the sixteenth century the cloak was an article of every-day wear, and was made with large loose armholes, through which the sleeves of the undergarment were passed, as is seen in portraits of Henry VIII. and the nobles of his court. Later it was shortened, and became in common use little more than a cape, though large and long cloaks were still used in traveling. In the latter part of the seventeenth century cloaks were abandoned, except for protection from cold and wet, on account of the changing fashion of the outer coat. Under the name of *Spanish cloak*, this garment was worn from about 1800 to 1840 in Great Britain and America, the shape being a half-circle; it had a broad collar, often of fur or of velvet, which was continued down the edges of the cloak on both sides in breadths of a foot or more. When in use, one of these edges was drawn across the breast and flung over the opposite shoulder with the breadth of fur or velvet turned outward, so as to form a decorative draping, falling from the shoulder behind. The same garment is still worn as the most common winter dress in certain Italian cities.

Clypeus.—Figure of Achilles, from a Greek red-figured vase.

By Huxley and other anatomists the front is included in this term, being distinguished as the *clypeus superior*, or *supraclypeus*. Norw. Sw. kol = Dan. kul, neut., coal (in both senses), orig. a burning coal; perhaps connected with Ir. Gael. gual, coal, and ult. with Skt. √jval, burn bright, flame. The Goth. word for a burning coal was hauri, houbille, Walloon hoie, ML. hulla, mineral coal; Gr. ἀνθραξ, a burning coal, also mineral coal (see anthracite), L. carbo(n)-, a burning coal, charcoal, in mod. use mineral coal (see carbon).] 1. 2. A solid and more or less distinctly stratified mineral, varying in color from dark-brown to black, brittle, combustible, and used as a fuel, not fusible without decomposition, and very insoluble. It is the result of the transformation of organic matter, and is distinguished by its fossil origin from charcoal (def. 1), which is obtained by the direct carbonization of wood. (See coal-plant.) Coal always contains more or less earthy matter, which is left behind in the form of ash after combustion. The quantity of the ash varies considerably, but in good coal does not usually exceed from 5 to 10 per cent. in weight. Coal can, however, be used for fuel, in default of a better material, when the amount of ash is much larger than this. Coal consists essentially of carbon, together with hydrogen, oxygen, and nitrogen; and sulphur is rarely if ever absent. The most general subdivision of coal is into hard and soft. The former is that coal which consists almost entirely of carbon; the latter is that in which there is a considerable percentage of hydrogen. Hard coal is generally called anthracite; bituminous coal, or simply coal, is the designation of the ordinary soft coal almost everywhere in general use where coal is burned, except in the eastern and Atlantic United States. In anthracite the bituminous or volatile matter constitutes usually less than 7 per cent. of the whole; in soft or bituminous coal it is usually more than 18 per cent. Coal intermediate in character between anthracite and bituminous coal is called semi-anthracite or semi-bituminous, according as it approaches anthracite or bituminous coal more nearly in character. The material driven off from coal on ignition is not really bitumen, for coal is insoluble, while bitumen is soluble. The name comes from the fact that bituminous coal behaves on being heated very much as bitumen itself does—that is, it swells up more or less, fuses together, and burns with a bright flame and considerable dense smoke. Coal occurs in all the geological formations, from the lowest in which land-plants have been found (the Devonian) up to the highest; but the coal of the great manufacturing countries, England, France, Germany, and the eastern United States, is nearly all of the same geological age, and is obtained from the formation called the Carboniferous. (See carboniferous.) The coal of Australia, India, and a part of that of China is of later geological age than the Carboniferous, being Mesozoic, and not Paleozoic. There is also a large quantity of good coal in various parts of the world in formations even more recent than the Mesozoic. In general, however, from the time of the Carboniferous on, the conditions

were continually growing less favorable for the formation of coal on a large scale; so that each successive age has less coal to show, and that on an average of poorer quality than the coal of the true Carboniferous epoch. (See lignite.) Also called stone-coal, mineral coal, and formerly sea-coal. [Coal in this sense is used as a collective noun without a plural; but in Great Britain the plural form is also used in speaking of a quantity of coal, with reference to the pieces composing it: as, to lay in a supply of coals; put more coals on the fire.]

It is brittle, burns with a weak flame, and exhales an odor which is generally disagreeable.—Buckwheat coal. See buckwheat.—Coal-boring bit. See bit¹.

coal-plant (kōl' plant), *n.* A more or less distinctly preserved or fossilized relic of vegetation found in connection with mineral coal, and regarded as representing, or as akin with, the vegetation of which the coal itself is composed. The vegetable remains which are in the best preservation and have been most studied occur chiefly in the strata between which the beds of coal are intercalated, and especially in the under-clay or clunch by which a large proportion of them are underlain. The shaly strata underlying the coal are also very frequently found to be crowded

with well-preserved forms of vegetable life. The vegetation accompanying coal varies with its geological age. (See *coal*.) As the Paleozoic or "Carboniferous" coal is— in Europe and the eastern United States, at least—much more important than that of any other geological age, it is this coal-vegetation which has been the object of the most careful investigation. While it is generally admitted that the coal itself has been formed from the aggregation and more or less complete decomposition of vegetable matter, it is often very difficult to prove this, except by microscopic examination, after preliminary chemical treatment by which most of the entirely disorganized portion of the coal has been removed. Among the materials of which the coal of different regions has been shown by various authorities to be made up are: bark of *Calamites*, *Lepidodendron*, and *Sigillaria*, spores of *Lepidodendron*, vascular portions of *Pecopteris* and other ferns, and leaves and bark of *Cordaites*. (See these words.) Vegetation of a higher order than the *Coniferæ* has not yet been proved to exist in connection with coal of Carboniferous age; by far the larger portion of the fossil plants of that epoch belongs to the *Cryptogamia*.

Among these products may be named paraffin, naphtha, benzol, creosote, anthracene, carbolic acid, naphthalene, pitch, etc. The basic oil of coal-tar is the most abundant source of the beautiful aniline colors, their various hues being due to the oxidation of aniline by means of acids, etc. (See *aniline*.) Coal-tar is made into asphalt for pavements, and with coal-dust forms by pressure an excellent artificial fuel. It is largely used, by itself and combined with other substances, to form preservative compositions for coating wood and metal. coca¹ (kō'kā), *n.* [S. Amer.] 1. The dried leaf of *Erythroxylon Coca*, natural order *Linaceæ*, a small shrub of the mountains of Peru and Bolivia, but cultivated in other parts of South America. The principal source of the drug as a commercial product is the province of Yungas in Bolivia, where the bushes, which are grown on the sides of the mountains, yield three crops a year. By far the greater part of the estimated annual product of 40,000,000 pounds is consumed at home. It is a stimulant, bearing some resemblance in its effects to tea and coffee, and has long been used as a masticatory by the Indians of South America. It relieves feelings of fatigue and hunger, and the difficulty in breathing experienced in climbing high mountains. The habit of chewing coca is an enslaving one. Coca is used in medicine as a stimulant and tonic; it yields the valuable alkaloid cocaine. Sometimes written *cuya*.

2. The plant itself.

They live on plants, and the larvae resemble scales, whence one of the names of the family. The eggs are deposited beneath the large shield-shaped body of the female. The males undergo complete metamorphosis, an exception in this order, and the apterous larvae become incased in a cocoon, and transform into quiescent pupae. The family is an important one, not only from the damage done by these insects to plants, but for their commercial value, some of them producing the coloring matter called cochineal, others secreting the substance known commercially as *lac*. entangled with those of other words related only remotely or not at all, namely: (1) *cock*¹, as in the desperate etym. ("Doth the *cock* neigh, too?") mentioned by Minshew; (2) *cock*², *cockish*, *cocky*, etc., with allusion to pertness or conceit; (3) *Cockaigne*, *Cockayne*, an imaginary country of idleness and luxury, supposed (erroneously) to be related, whence its second meaning, 'cockneydom'; (4) *cock*³, *cock*⁴, and *coax*, *v.*, pamper, fondle, akin in sense but appar. not in origin. The only solution of *cockney* phonetically satisfactory is historically unsupported, namely, < OF. **coquiné* (ML. **coquinatus*), taken in some such sense as 'a vagabond who hangs around the kitchen,' or 'a child brought up in the kitchen,' or 'a child fed in the kitchen, a pampered child.' The word would then be closely connected with OF. *coquiner*, beg (> *coquin* (ML. *coquinus*, ME. *cokin*), a beggar, a rogue, F. a rogue, a rascal, *coquinerie*, beggary, F. roguery, *coquineau*, a scoundrel), < L. *coquinare*, serve in a kitchen, cook (hence the possible later sense of 'hang about a kitchen'), < *coquina*, a kitchen (> ult. 3. A native or a permanent resident of London: used slightly or by way of contempt, and generally with allusion to peculiarities of pronunciation or insularity or narrowness of views.
 A *cockney*, applied only to one borne within the sound of Bow-Bell, that is, within the City of London; which term came first out of this tale: That a Citizens sonne riding with his father out of London into the Countrey, and being a noyce and meerly ignorant how corne or cattle increased, asked, when he heard a horse neigh, what the horse did. His father answered, "The horse doth neigh." Riding farther he heard a cocke crow, and said, "Doth the cocke neigh, too?" and therefore *Cockney* or *Cocknie*, by inversion thus: *incock*, *quasi* *incoctus*, i. [e.] raw or vnrripe in Countreymens affaires. But in these daies we may leane the terme *Cockney*, and call them *Apricocks*, in Lat. *præcoeca*, i. [e.] *præmatura*, i. NL. *cocus*, now *cocos*, > D. G. Dan. Sw. *kokos* (in comp.), *cocoo*), prob. *< Gr. kouka*, the *cocoa-tree*, *cocoanut*; perhaps of Egyptian origin: cf. *kôis*, an Egyptian kind of palm. The resemblance of the Sp. Pg. name to Sp. Pg. *coco*, a word used to frighten children, a bugbear, is prob. accidental. The spelling *cocoa* is due to confusion with *cacao*, which is also spelled *cocoa*: see *cocoa*².] A palm belonging to the

genus *Cocos*, producing the cocoanut. *C. nucifera* is everywhere cultivated in tropical regions, but more especially on islands or near the sea. It has a cylindrical stem rising to a height of 60 to 90 feet, and surmounted by a crown of feather-like leaves from 18 to 20 feet long. The small white flowers grow on a branching spadix, inclosed in a hard tough spathe. The fruits, called *cocoanuts*, are in bunches of from 12 to 20, and are of a subtriangular ovoid form, 12 inches long by 6 broad. They have each a single seed inclosed in a very hard shell, and surrounded by a thick fibrous rind or husk. This fiber, called *coir*, is made into cordage, matting, brushes, bags, etc. The flesh or meat of the cocoanut is a white pleasant-tasting mass, soft and gelatinous when young, but afterward lining the shell in a thick close layer; it is largely used as a condiment and in cookery and confectionery, and yields the valuable cocoanut-oil (which see). The nut also contains when fresh from one to two pints of a clear pleasant liquid called the *milk*. The mature shell takes a high polish, and is made into drinking-cups and other utensils and ornaments. Its various uses make the cocoanut an important article of commerce. A spirit called *toddy* or *arrack* is made from the sweet juice of the spathe. Indeed, almost every part of the tree is employed in tropical countries for some useful purpose. The heart, which is seldom sound, is of a light yellowish-brown color, which changes to a deep brown, almost black. The firm part of the trunk is the so-called *porcupine-wood*, which is a very hard and durable, and is much used for all kinds of turnery, and especially for inlaying. Also called *cocoa-tree*, *cocoanut-tree*.

But of greater admiration is the *Coquo*, being the most profitable tree in the world, of which in the Islands of Maldiva they make and furnish whole ships.

Cocoanut matting. See *matting*.—**Double cocoanut**, or *coco-de-mer*, the fruit of a remarkable palm, *Lodoicea Sechellarum*, found native only on the Seychelles, in the Indian ocean, and growing to a height of from 50 to 100 feet, with a crown of gigantic palmate leaves. The fruit often weighs 40 or 50 pounds, and usually contains 4 nuts, which are 18 inches long, lobed at each end. Before matting the inside of the nut is soft and eatable. The hard black shell is carved into ornaments, the young leaves yield an admirable material for baskets and plaited work, and the older leaves are used for partitions and thatching. The nuts, driven across the sea by the monsoons, were known in India long before the discovery of the tree which produced them, and wonderful stories were current respecting their origin.—**Sea-cocoanut**, of Jamaica, the fruit of a species of *Mantecaria*, a palm of Trinidad and the South American coast, often washed ashore upon that island.

It lives in deep burrows and is diurnal in habit.

It is prepared by the natives of the tropics, where the fruit abounds, both by decoction and by expression, and is used for lighting, the preparation of unguents, etc. It is exported to a considerable extent, and is also manufactured in Europe and the United States from cocoanuts or from copra, by expression or by treatment with sulphid of carbon. Chemically, it consists of a peculiar subatace, cocoinin, with a small quantity of olein. By ammonification cocoinin yields glycerin and cocinic acid. The oil is white, of the consistence of lard, and has a texture somewhat foliated. It is largely used in the preparation of candles and the so-called *filling-soaps*. Also called *cocooil*.

Its action is such as to give high velocities to the projectile with low or moderate pressures in the bore. The name is derived from its resemblance in color to *cocoa* or chocolate. 1. The common English name of the *Gadus morrhua*, an anacanthine fish of the family *Gadida*, and its best-known representative. It is a valuable food-fish, and is widely distributed throughout the northern and temperate seas of both hemispheres, but does not enter the Mediterranean, though found as

(From Report of U. S. Fish Commission, 1884.)

far south as Gibraltar. The principal cod-fisheries are on the banks of Newfoundland and the coasts of New England, but very valuable ones also exist on the coasts of Norway. It is a very voracious fish, living in water from 25 to 50 fathoms deep, where it always feeds close to the bottom, and will take almost any kind of bait which may be offered. The cod reaches maturity at the end of the third year, when it usually measures about 3 feet in length and weighs from 12 to 20 pounds; individuals, however, have been taken weighing from 50 to more than 100 pounds. The cod is of great commercial importance both as a food-fish and as the source of cod-liver oil, which possesses nutritive and therapeutic qualities of much value. Some variations in the size or quality of cod are indicated by terms expressive of the location in which they are taken, as *deep-water* or *shoal-water* cod, *shore* or *inshore* cod, etc. The name is also extended, as a popular family term equivalent to *Gadida*, to all the species, and in different English-speaking countries is misapplied to various species of scorpennids, chiroids, serranids, sparids, percophidids, and ophidids.

2. A chiroid fish, *Ophiodon elongatus*, of the Pacific coasts of North America, universally called *cod* and *codfish* where the true cod is unknown. Also called *cultus-cod*.—3. This name is becoming a commercial term to describe codfish of the finest quality in the United States.—**Herring-cod**, a variety of cod of southeast Maine.—**Murray cod**, a serranoid fish, *Oligoriza maquariensis*, of the Australian rivers.—**Native cod**, cod living near the shore: distinguished from *bank cod*.—**Night cod**, cod that will bite at night.—**Pine-tree cod**, cod living along the southeast coast of Maine.—**Red rock-cod**, in New South Wales, species of *Scorpena*, *S. cardinalis*, *S. cruenta*, and *S. bynoensis*.—**Rock-cod**. (a) Cod living on a rocky bottom. (b) Misapplied at San Francisco to a sebasteine fish, *Sebasticthys navidus*, and about Puget Sound to a chiroid fish, *Hexagrammus decagrammus*.

The name *Rock cod* applied [along the Pacific coast] to other Chiroids and to Sebasticthys, and thence even transferred to Serranus, comes from an appreciation of their affinity to Ophiodon, and not from any supposed resemblance to the true codfish.

Jordan.

(c) A serranoid fish, *Serranus (?) cuvieri*, of South Africa. (d) A percophid fish, *Percis colias*, of New Zealand.—**School cod**, cod occurring in large schools.—**Worm-cod**, cod feeding largely on worms and found near shore. (See also *cultus-cod*, *tom-cod*.)

A digest or compendium; an orderly arrangement or system; a body of rules or facts for the regulation or explication of any subject: as, the *military code*; the *code of honor* (see below).

The copy of the Gothic Bible known as the *Codex Argenteus* (silver manuscript) from its silver letters (initials and divine names in gold), formerly at Werden in Westphalia, now at Upsala in Sweden, is noted both for this peculiarity and as being the most important of the few extant remains of the Gothic language. Among secular books, one of the most celebrated is the *Codex Ambrosianus* of the Iliad, containing 58 pictures, of all existing manuscript illustrations retaining most of the character of good antique art.

J. Fiske, *N. A. Rev.*, CXXVI. 37.

Both those who affirm and those who deny the expediency of codifying the English law, visibly speak of *codification* in two different senses. In the first place, they employ the word as synonymous with the conversion of Unwritten into Written Law. *Codification* is, however, plainly used in another sense, flowing from the association of the word with the great experiment of Justinian, . . . to give orderly arrangement to this written law—to deliver it from obscurity, uncertainty, and inconsistency—to clear it of irrelevancies and unnecessary repetitions—to reduce its bulk, to popularize its study, and to facilitate its application. *Maine*, *Village Communities*, p. 302.

The fact that the verb is found chiefly in the pret. *coft* suggests that the present *coff* is developed from the pret. *coft*, the latter being in this view merely a var. of *caught* (ME. *caught*, *caght*, *cought*), etc., pret. of *catch*¹, in the sense of 'get, obtain', with the common change of the guttural *gh* to *f* as in *draught* = *draft*, *cough*, pron. as *coff*, etc.: see *catch*¹, *v.* 1. coffee (kof'ē or kōf'ē), *n.* [First in 17th century, in various forms *coffe*, *coffa*, *cauphe*, etc.; = *D. koffij* = *G. kaffee* (after *E.*), now *kaffee* (after *F.*) = *Dan. Sw. kaffe* (after *F.*) = *Russ. kofe*, *kofet* = *F. cafe*, *coffe*, now *café* (whence the half-English *café*, a coffee-house) = *Sp. Pg. café* = *It. caffè* (*NL. choava*, now *coffea*), *< Turk. qahve*, *< Ar. qahve*, *qahwa*, coffee (as a liquid); cf. *Ar. bonn*, the coffee-berry.] 1. The berry of trees belonging to the genus *Coffea*, natural order *Rubiaceae*. Several species, but principally *C. Arabica*, produce the coffee of commerce. It is a native of Arabia and Abyssinia, but is now extensively cultivated throughout tropical countries. It will grow to the height of 16 or 18 feet, but is seldom permitted to exceed 8 or 9 feet, for the convenience of gathering the fruit. The stem is upright, and covered with a light-brown bark; the branches are horizontal and opposite. The flowers grow in clusters at the bases of the leaves, are pure white, and of an agreeable odor. The fruit is a small, red, fleshy berry, having the size and appearance of a small cherry. Each berry contains two seeds, commonly called *coffee-beans* or *coffee-nibs*. When ripe the berries are gathered, and the outer pulp and the parchment-like covering of the seeds are removed. The Mocha coffee from Yemen in Arabia is reputed the best; but the principal supplies are now obtained from Ceylon, Java, the West Indies, Brazil, and Central America. The Liberian coffee-tree, *C. Liberica*, of western tropical Africa, has recently

been introduced into cultivation. It grows to a greater size and yields a much larger berry than *C. Arabica*, and thrives in low damp regions where the latter will not flourish. What is known as the *male coffee-berry* is simply a re-

Fruiting Branch of Coffee-plant (*Coffea Arabica*). *a*, flower; *b*, section of berry, showing enclosed nutlets and position of embryo.

sult of the occasional coalescence of the two seeds of the fruit into one, and differs in no other respect from the ordinary berry. The name *cherry-coffee* is given to the coffee-berry as it comes from the tree, before the pulp has been removed or the seeds have been dried.

2. A drink made from the seeds of the coffee-tree, by infusion or decoction. Before being used the seeds are roasted, and then ground in a coffee-mill, or, as in the East, pounded. The beverage is best when made with coffee-beans freshly roasted and ground. Coffee acts as a slight stimulant, promoting cheerfulness and removing languor; but in some cases it induces sleeplessness and nervous tremblings. The use of it originated in Abyssinia, passed to Arabia several centuries later, and is said to have been made known in Europe by A. Rauwolf, a German physician, whose travels appeared in 1573.

And sip of a drink called *Coffa* in little china dishes, as hot as they can suffer it. *Sandys, Travailles, p. 52.*

Although they be destitute of Taverns, yet they have their *Coffa-houses*, which something resembles them.

Sandys, Travailles, p. 51.

The *coffee-house* must not be dismissed with a cursory mention. It might indeed, at that time, have been not improperly called a most important political institution. . . . The *coffee-houses* were the chief organs through which the public opinion of the metropolis vented itself. . . . Every man of the upper or middle class went daily to his *coffee-house* to learn the news and discuss it. Every *coffee-house* had one or more orators, to whose eloquence the crowd

listened with admiration, and who soon became what the journalists of our own time have been called—a fourth estate of the realm. *Macaulay.*

At the present day every traveller is struck with the almost complete absence in London of this element of Continental life, but in the early years of the eighteenth century *coffee-houses* were probably more prominent in London than in any other city in Europe.

The act or state of cohering, uniting, or sticking together; specifically, in phys., the state in which, or the force by which, the molecules of the same material are bound together, so as to form a continuous homogeneous mass. This force acts sensibly at insensible distances—that is, when the particles of matter which it unites are placed in apparent contact. At insensible distances it is a much greater, at sensible distances a much smaller, force than gravitation, so that it does not follow the law of variation of the latter. It unites the particles of a homogeneous body, and is thus distinguished from adhesion, which takes place between the molecules of different masses or substances, as between fluids and solids, and from chemical attraction, which unites the atoms of a molecule together. The power of cohesion in a body is estimated by the force necessary to pull its parts asunder.

In general, cohesion is most powerful among the particles of solid bodies, weaker among those of fluids, and least of all, or entirely wanting, in elastic fluids, as air and gases. Hardness, softness, tenacity, elasticity, malleability, ductility, and in crystallized bodies cleavage, are to be considered properties dependent upon cohesion. The most powerful influence which tends to diminish cohesion is heat, as shown in the change of a solid to a liquid, or of a liquid to a gas, which is effected by it. See *gas* and *liquid*.

2. In bot., the congenital union of one part with another. If the parts are similar, as two stamens, their union is specifically called *coalescence*; if dissimilar, as calyx and ovary, it is styled *adnation*.

3. Connection; dependence; affinity; coherence. [Now rare in this sense.]

Ideas that have no natural cohesion.

The greatest strength of that prevailing Faction [the Romish religion] lies in the close union and cohesion of all the parts together.

Stillingfleet, Sermons, II. i.

Cohesion figures, a class of figures produced by the attraction of liquids for other liquids or solids with which they are in contact, and divided into *surface, submersion, breath, and electric cohesion figures*. It was found by C. Tomlinson, an English physicist, that a drop of liquid, as of oil or alcohol, spreads itself out on the surface of water always in a definite figure, the figure differing with each fluid dropped on the water; and he suggested that this might be employed as a test for oils, etc. The same principle holds true with regard to liquids which, from greater specific gravity, sink slowly to the bottom in water, each liquid submerged forming a definite figure peculiar to itself.

Breath figures are produced by putting a drop of the liquid to be examined on a slip of mica and breathing on it, when again each fluid takes a distinct characteristic shape. *Electric cohesion figures* are produced by electrifying drops of various liquids placed on a plate of glass.—**Magnetic cohesion**, that power by which two magnetic bodies adhere together, as iron to a piece of lodestone.

Thus, in the United States, under the law of 1837, it is 15.988 to 1: that is, one pound of gold can be coined into as many dollars as 15.988 pounds of silver. The coinage ratio is intended (except for subsidiary coins), where bimetallicism is desired, to be identical with the average commercial ratio; if this is not the case the metal which is undervalued disappears from circulation as money. Thus under the law of 1792 the coinage ratio was fixed at 15 to 1, but this undervalued gold and it disappeared from circulation; in 1834 the ratio was changed to 16.002 to 1, and in 1837 to 15.988 to 1, but this undervalued silver and it practically disappeared from circulation (except in the form of subsidiary and abraded coins) until 1873, when it was demonetized. Since that date the fall in the value of silver has brought the commercial ratio (1896) down to about 32 to 1.—**Free coinage**. See *free*.—**Garbling the coinage**. See *garble*.

coke1 (kōk), *n.* [Sometimes spelled *coak*; same as *E. dial. cokes*, *coaks*, cinders. Cf. *grind-coke*, a worn-down grindstone. Hence *F. coke*, *Sp. cok*, *G. koaks*, *kohks*, usually *coaks*, etc., *coke*.] The solid product of the carbonization of coal, bearing the same relation to that substance that charcoal does to wood. It is an important article in metallurgy, since few bituminous coals can be used for the manufacture of iron without having been first coked. The *coking coals*, as they are called, are bituminous, and such as contain but a small percentage of water. Hence the coals as recent as the Tertiary—brown coals or lignites—rarely furnish *coke*; that is, the material left behind after the bituminous or volatile matter has been driven off in a powder, and not the coherent somewhat vesicular substance to which the name of *coke* is given. The nature of the difference between *coking* and *non-coking coals* has not yet been fully made out, and it is stated on good authority that some coal which *cokes* readily when first mined does not do so after having been exposed to the atmosphere, if only for a few days. The use of *coke* dates certainly as far back as the middle of the seventeenth century. Its preparation was formerly known as *charking* or *charring*, and the word was often, and is still occasionally, written *coak*.

The essential features are a chamber to contain the coal, with openings at various points for the admission of air, which can be closed as required during the progress of the operation, and a furnace or fire-chamber to supply the necessary heat. In some forms the gases which are evolved are utilized as fuel for the oven itself, or for a steam-boiler, or for some similar purpose, or they are condensed as tar, etc.

In the Roman Catholic, Anglican, and other Western liturgies: (a) A concise prayer, varying according to the day, week, octave, or season, recited before the epistle, regularly consisting of one sentence, and asking for some grace or blessing with reference to some teaching of the epistle or gospel, or both. A collect is composed of an address to the Trinity or to one of the Divine Persons, a petition thus introduced, and the pleading of Christ's merits or final ascription to a Person of the Trinity. One collect may be used alone or several in succession. Collects regularly belong to the eucharistic office, but are repeated in the day-offices (hours, morning and evening prayer), thus forming a constant link between the latter and the altar service. They are characteristic of Western liturgies and offices, not being known in the Eastern churches. Almost all those still in use are very ancient, and the origin of this form of prayer is at least as old as the fifth century. Leo the Great (440-61) and Gelasius I. (492-96) are reputed the first composers of collects. See *oratio*.

As used in current speech, and also in economics, no very definite line of distinction between communism and socialism can be drawn. Generally speaking, communism is a term for a system of common property, and this should be accepted as the reasonably correct usage of the word; but even by socialists it is frequently used as practically synonymous with socialism. *Collectivism* is a word which has recently come into vogue to express the economic basis of socialism as above explained.

colloidion (kol-lŏ'di-ŏn), *n.* [NL., also *colloidium*, < Gr. *κόλλωδης*, like glue, < *κόλλα*, glue, + *ειδος*, semblance.] A substance prepared by dissolving pyroxylin or guncotton in ether, or in a mixture of ether and alcohol. It forms a useful substitute for adhesive plaster in the case of slight wounds. When the solution is applied to the wound, it immediately dries in a semi-transparent, tenacious film, which adheres firmly to the part, and protects the wound or abrasion. With the addition of a small quantity of iodides and bromides, colloidion is employed as the basis of a photographic process, called the *colloidion* or *wet process*. To obtain a negative picture by this process a glass plate is covered with a film of colloidion, which is sensitized by a salt (usually the nitrate) of silver, and the plate exposed in the camera. The latent image obtained is then developed by the application of a solution of iron protochloride, water, and acetic acid, and the unprecipitated silver remaining in the film is dissolved by a fixing solution of sodium hyposulphite or of potassium cyanide. To obtain a positive picture, a sheet of paper is laid upon the face of the negative in a frame, the paper having been sensitized by floating on a solution of silver nitrate, or by any other of several methods. The frame is then exposed to light in such a manner that the rays, to reach the paper, must pass through the negative, and the exposure is continued till the tone is sufficiently deep, after which the tint is improved by means of gold chloride and other salts, and the picture fixed with sodium hyposulphite. Positive pictures may also be obtained direct by the colloidion process. Colloidion is used also as a water-proof coating in place of varnish, especially to protect lucifer matches from the effects of dampness.

They are distinguished by the gelatinous character of their hydrates. Although often largely soluble in water, they are held in solution by a most feeble force. They appear singularly inert in the capacity of acids and bases, and in all the ordinary chemical relations. But, on the other hand, their peculiar physical aggregation, with the chemical indifference referred to, appears to be required in substances that can intervene in the organic processes of life. The plastic elements of the animal body are found in this class. As gelatine appears to be its type, it is proposed to designate substances of the class as *colloids*. *J. Graham*, Phil. analysis of a rhythmical period into cola or sections. See *colon*¹, 2.—2. In *paleography*, measurement of manuscripts by cola or lines of determinate length; stichometry. See *stichometry* and *colon*¹, 3.

colon¹ (kō'lon), *n.*; pl. *cola* (-lā) in senses 1, 2, and 3, *colons* (-lonz) in sense 4. [= D. *colon* = G. Dan. Sw. *kolon* = F. Sp. Pg. *colon* = It. *colona*, < L. *colōn*, a member of a verse or poem, < Gr. *κόλον*, a member, limb, clause, part of a verse.] 1. In *anc. gram.* and *rhet.*, one of the larger or principal divisions of a sentence or period; a long clause, or a group of minor clauses or commata. See *comma*, 1.—2. In *anc. pros.*, one of the members or sections of a rhythmical period, forming an uninterrupted sequence of feet, united under a principal ictus or beat: sometimes called a *series*. A colon could not consist of more than 6 trisemic, 5 tetrasemic or pentasemic, or 3 hexasemic feet. It usually corresponded to one of the lines of a modern couplet, triplet, or stanza, or formed part only of a longer line. A *pure colon* is a colon consisting of feet of one kind only; a *mixed colon* is composed of feet of different kinds. See *period*.

3. In *paleography*, a long clause or group of clauses, or a series of words of about the average length of such a group, estimated as approximately equal to a dactylic hexameter in extent—that is, as containing from 12 to 17 syllables. A colon in this sense was frequently written as a separate line in manuscript, and served to measure the length of a book or treatise. See *colometry* and *epos*.

4. A mark of punctuation formed by two dots like periods placed one above the other (:), used to mark a discontinuity of grammatical construction greater than that indicated by the semicolon and less than that indicated by the period. The colon is commonly used (1) to emphasize a close connection in thought between two clauses of which each forms a complete sentence, and which might with grammatical propriety be separated by a period; (2) to separate a clause which is grammatically complete from a second which contains an illustration or amplification of its meaning; thus, in this work illustrative clauses introduced by "as" are separated from the definition by a colon; (3) to introduce a formal statement, an extract, a speech in a dialogue, etc. Originally it was the mark of the termination of the grammatical or paleographic division called by the same name, and it is now frequently used to mark off metrical periods in prose intended for chanting.

colon² (kō'lon), *n.*; pl. *colons* (-lonz), *cola* (-lā). [= D. *colon* = G. Dan. Sw. *kolon* = F. Sp. Pg. *colon* = It. *colona*, < L. *colōn*, *colūm* (prop. *colōn*, *colūm*), < Gr. *κόλον* (sometimes incorrectly written *κόλον* by confusion with *κόλον*, a member: see *colon*¹), the large intestine, also food, meat, fodder. Hence *colic*.] 1. In *anat.*, a portion of the intestinal tract, the so-called "large" as distinguished from the "small" intestine, continuous from the ileum to the rectum; the great gut, beginning at the cæcum and ending in the sigmoid flexure. In man and mammals generally the colon is distinguished from the preceding small intestine by its greater caliber, and by its sacculature, due to the particular distribution of its circular muscular fibers, which constrict it at some places and allow it to bulge out at others, making a series of pouch-like expansions. It may also present continuous bands of longitudinal fibers, or lengthwise constrictions, so that the cross-section is not circular. The colon may not be distinguishable in size or appearance from the rest of the intestine, as in birds, where its commencement is marked only by the presence of a cæcum or of two cæca; and when these are wanting, there is no distinction. In man the course and situation of the colon are definite, owing to the binding of the gut in place by the mesocolon and gastrocolic omentum. Beginning at the cæcum and ascending by the right kidney, it passes under the concave surface of the liver and the bottom of the stomach to the spleen; thence descending by the left kidney, it passes in the form of an S to the upper part of the sacrum, where it becomes the rectum. The parts of the colon are designated according to their position or direction: as, the *right lumbar* or *ascending colon*; the *arch* of the colon, or *transverse colon*; the *left lumbar* or *descending colon*; and the sigmoid flexure, or *left iliac colon*. See *cuta* under *alimentary* and *intestine*.

2. In *entom.*, the second portion of an insect's intestine, generally broader than the preceding portion or ileum. It may be straight or convoluted, terminating at the anal opening, or separated from it by a short rectum.

The change of *l* to *r* in the Sp. Pg. form is due to dissimilation, or perhaps to association with Sp. L. *corona*, Pg. *corôa*, a crown; cf. Sp. dim. *coronel*, a crown (in heraldry): see *coronal*. The E. word, orig. pron. as spelled, *cor-o-nel*, *cor'o-nel*, became, by regular phonetic change, *cor'nel*, and now *cur'nel* (kér-nel) (being often so spelled in novels and character sketches which seek to be realistic, retaining the *r* of its Sp. form; but the spelling was soon changed to suit the F. form, which was much more familiar to the eye of readers. Hence the later occasional pronunciations kol-ō-nel', kol'ō-nel'.] The chief commander of a regiment of troops, whether infantry or cavalry, next in rank below that of a general officer—in the United States army, of a brigadier-general. In the British army, except in the artillery and engineers, the office of colonel is often honorary, and is generally conferred on distinguished officers and princes of the blood royal, the real command resting with the lieutenant-colonel in each battalion, who after five years of service becomes a colonel. Generals who have had what is called "a regiment given to them" as a reward for service, and virtually as a retirement, have the rank of colonel. In the Russian, German, and Austrian armies the colonel of each regiment, holding the title only as an honor, is usually a member of some princely or other eminent family, often foreign, and sometimes appointed in childhood. Often, as a title, abbreviated *Col*.

Hee was . . . coronell of the footemen, though that tearm [was] in those dayes [1544] unuzed.

Colonel Bogie. In *golf*, an imaginary player, to whom is assigned, by the committee in charge, a score against which the players have to play.

This "Bogie" score usually represents par play over the green, and it is made known before the competition begins, so that each competitor knows what he has to do at every hole. Each player counts his score at every hole, and if he holes out at that particular hole in fewer strokes, or in the same number, or in more than the appointed number, he wins, halves, or loses the hole to "Bogie," as the case may be. At the end of the game the number of holes won from "Bogie" are placed against those lost to "Bogie," and the player who is the greatest number of holes up or the fewest down wins the competition.

colony (kol'ō-ni), *n.*; pl. *colonies* (-niz). [Early mod. E. *colonic*; = D. *kolonie* = G. *kolonie* = Dan. *Sw. koloni*, < F. *colonie* = Sp. Pg. It. *colonia*, < L. *colonia*, a colony, < *colonus*, a husbandman, colonist, < *colere*, till, cultivate, dwell: see *cult*, *cultivate*, etc.] 1. A company or body of people who migrate from their native country or home to a new province, country, or district, to cultivate and inhabit it, but remain subject to or intimately connected with the parent state; also, the descendants of such settlers so long as the connection with the mother country is retained. Among the ancient Greeks the simple colony, which was not necessarily dependent upon the parent state except in religious matters, must be distinguished from a *cleruchy* (which see). Among the Romans the earliest colonies, so called, were merely garrisons in a hostile territory. Later, colonies were founded for the benefit of the poor of Rome; but Sylla restored the military character to the colony, which became in general a foundation for the benefit of veteran soldiers who had served their time. The colonists retained their Roman citizenship, and received their lands by lot, the original inhabitants of the site being subordinated to them. In American history the name is given especially to the thirteen separate communities along the Atlantic coast under English rule which combined in the revolution, and were formed in 1776 into the United States of America. They were (in geographical order) New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, North Carolina, South Carolina, and Georgia. These were all originally English colonies excepting New York and Delaware, which were for a time respectively Dutch (as New Netherland) and Swedish (as New Sweden). Their governments were by charter (in Massachusetts, Rhode Island, and Connecticut), proprietary (in Pennsylvania, Delaware, and Maryland), or royal (in the remaining colonies). In each (except Rhode Island and Connecticut, which chose their own governors) the governor was appointed by the crown or by the proprietaries. The crown claimed a veto on legislation, and jurisdiction of appeals from the court of last resort.

Once on a time thirteen famous colonies of the older England voted that they were and ought to be free and independent States. By that vote they ceased, in the sense of a colonial office, to be English colonies any longer. In the sense of history they became English colonies more truly than before. *E. A. Freeman*, *Amer. Lects.*, p. 25.

(b) In zool., a polyp-stock, polypidom, or some similar aggregate of individuals: applied to various actinozoans, hydrozoans, and polyzoans, to the social or compound ascidians, etc. Thus, a bit of living coral is a colony of coral polypites. Gr. *χρoιά*, *χρoία*, surface, skin, color.] 1. Objectively, that quality of a thing or appearance which is perceived by the eye alone, independently of the form of the thing; subjectively, a sensation, or the class of sensations, peculiar to the organ of vision, and arising from stimulation of the optic nerve. The proper stimulus to the sensation of color is light radiated from a luminous body or reflected from the surface of a non-luminous body; but it can be induced by other means, as by an electric shock. When a ray of white light is analyzed, as by a prism, into parts each of a definite wave-length, the parts show the colors red, orange, yellow, green, blue, indigo, and violet, which form a continuous spectrum, each color shading gradually into the next. (See *light* and *spectrum*.) These colors have been termed *primary* or *simple*, though in fact they do not excite simple color-sensations. If the colors of the spectrum are recombined, white light reappears. Similarly, if two colors which lie near together in the spectrum, both on the same side of light of wave-length 0.524 micron, are mixed (for example, if two rays of colored light are thrown upon the same spot so as to be reflected from it together), the intermediate colors are nearly produced. If, however, the colors, being on different sides of that point, are taken further and further apart in the spectrum, the mixture becomes gradually whiter (less saturated) until two colors are found which produce pure white light. If the colors are still further removed, a purple results. Those pairs of colors which when mixed produce white or gray light are called *complementary colors*; such are red and green-blue, orange and blue, yellow and indigo-blue, green-yellow and violet. The sensations produced by the different parts of the spectrum, however, vary with the intensity of the light: thus, orange when highly illuminated looks more yellow than when darker, and the main effect of increasing the illumination of a color is to add a yellow color-sensation, called the *color of brightness*. If, instead of mixing spectral colors, colored pigments are mixed, very different results are obtained: thus, while spectral blue and yellow produce white, blue and yellow pigments produce green. This is due to the fact that the blue pigment absorbs nearly all the yellow and red light, while the yellow pigment absorbs the blue and violet light, so that only the green remains to be reflected. Colors vary in *chroma*, or freedom from admixture of white light; in brightness or *luminosity*; and in *hue*, which roughly corresponds to the mean wave-length of the light emitted. The numbers which measure these quantities, as well as any other system of three numbers for defining colors, are called *constants of color*. Pure white light and darkness are not ordinarily regarded as colors; but white and black objects are commonly spoken of as colored, although the former reflect and the latter absorb all the rays of light without separating them into colors properly so called.

2. In painting: (a) The general effect of all the hues entering into the composition of a picture. (b) An effect of brilliancy combined with harmony: said either of a work in different colors or of a work in monochrome, or of an engraving: as, the picture has no color; the engraving is full of color.

Though there is no color, strictly speaking, in an engraving consisting merely of black and white lines, yet the term is often . . . applied to an engraving which is supposed, from the varied character of its lines and the contrast of light and shade, to convey the idea of varied local color as seen in a painting. *Chatto*, *Wood Engraving*, p. 213.

3. Any distinguishing hue, or the condition of having a distinguishing hue—that is, a hue different from that which prevails among objects of the kind concerned, whether the prevailing hue be positive, as green, or neutral or negative, as white or black; hence, (a) in a picture or view, or in a fabric or other material dyed or painted, any hue, especially a pure tint (often implying a vivid one), other than black and white; (b) in human beings, from the standpoint of the white races, a hue or complexion other than white, and especially black; (c) in bot., any hue except green. See *colored*, 2.—4. The natural hue of the face; a red or reddish tint; flush; bluish; complexion in general.

(b) The timbre or quality of a musical tone. See *timbre*.—Absorption of color. See *absorption*.—Accidental colors, acoustic color, adjective color. See the adjective.—Application colors. It implies an illegal act.—Color of title, semblance or appearance of title, irrespective of its validity. According to the stricter authorities, to give color of title the instrument should be good in form, identify the property, profess to convey it, and be duly executed; and in such case possession under it may ripen into perfect title, irrespective of the void or voidable character of the instrument.—Confluent colors. See *confluent*.—Distemper colors, colors ground in water to a creamy consistency, to which is added a sizing of glue or white of egg to make them adhere to the surface to which they are applied. According to the Roman sequence of colors, white, as the color of purity and joy, is used on the festivals of Christ, the Virgin, angels, and saints not martyrs, and at marriages; red, as the color of blood, on the feasts of the Holy Cross and of martyrs, and also at Whitsuntide with reference to the tongues of fire (Acts ii. 3); violet or purple, as the penitential color, in Advent, Septuagesima, etc., Lent, and on vigils, etc.; green, the prevailing color of natural vegetation, and symbolic of hope, on days and during seasons not otherwise distinguished, especially from Trinity to Advent Sunday, both exclusive; black, on Good Friday, at funerals, and at services for the departed. These colors are widely used in Anglican churches also, though less frequently for vestments than for hangings. Some Anglican churches have revived the old English or Sarum colors, namely, red as the ordinary Sunday color, as a penitential color on Ash Wednesday, Good Friday, Easter Even, and Whitsun Even, and also on the same days as in the Roman use; white, throughout Eastertide; yellow, for feasts of confessors; blue, indifferently with green; and brown or gray with violet, for penitential seasons. In the Greek Church vestments, etc., of various colors are used, but there is no fixed or habitual sequence as in the West, except that red is preferred for Lent.—Fast colors, those colors which do not wash out or fade easily from exposure to the sun.

See *ground*, a.—High color. (a) A hue which excites intensely chromatic color-sensations. (b) Redness of the complexion.—Intense color, a high color.—Japan colors, colors ground in a medium called Japan. They are used by coach- and car-painters, and are often called *coach-colors*. They are thinned with turpentine before using, and dry dead or flat, that is, without any gloss. See *ecclesiastical colors*, above.—Local color. (a) In painting, the hue, or combination of hues, special to any object or part. (b) A general system of light and shadow upon which the modeling and tinting of details is executed; *chiaroscuro*.

H. James, Jr., *Trans. Sketches*, p. 11.

Hence—(d) Analogous characteristics in a literary composition.—Low color, a color of little chromatic intensity.—Mixture of colors, a color which throws upon the retina a sum of lights similar in quantity, and proportionate in intensity, to the lights which would be projected by the constituent colors, the sum of the proportions being unity. Thus, if A, B, and C are the lights thrown upon the retina by three colors, and another color projects a light which is the sum of $\frac{1}{2}$ A, $\frac{2}{3}$ B, and $\frac{1}{4}$ C, then the latter is said to be a mixture of A, B, and C.—Moist color. See *water-color*, below.—Neutral color, a color which matches a mixture of white and black.—Oil-color, a pigment of any kind ground in linseed- or poppy-oil. color-blindness (kul'or-blind'nes), *n.* Incapacity for perceiving colors, independent of the capacity for distinguishing light and shade, and form. It is not a mere incapacity for distinguishing colors (for this might be due to want of training), but an absence or great weakness of the sensations upon which the power of distinguishing colors must be founded. Color-blindness may be *total*, that is, the absence of all perception of colors as such, independently of light and shade, all colors appearing simply as shades; or *partial*, the entire or partial inability to distinguish particular colors independently of difference of light and shade. The most common form of the latter defect is the inability to perceive red as a distinct color, red objects being confounded with gray or green, and next in frequency is the inability to perceive green. The color which to a normal eye is complementary to the defective color appears as gray; and a mixture of white and black (gray) of the proper luminosity certainly cannot be distinguished by the color-

blind from the defective color (red or green). The results of statistical inquiries as to the prevalence of color-blindness show its existence in from 2 to 6 per cent. of males, while among women the number of cases seems to be considerably under 1 per cent. It consists essentially of two glass tubes of the same size, placed side by side on a stand. They are about half an inch in diameter and 15 inches high, and graduated. D. 80. A large portion of the structure still exists, part of the wall being entire. The outline of the Colosseum is elliptic, the exterior length of the building being 607 feet, and its breadth 512 feet; it is pierced with 80 vaulted openings or vomitories in the ground story, over which are superimposed on the exterior face three other stories, the whole rising perpendicularly to a height of 159 feet. It was probably written during the earlier part of Paul's imprisonment at Rome, about A. D. 62. Gnostic and ascetic teachers had invaded the church, and the object of the epistle is to set before the disciples their real relation to Christ, and the consequent largeness of both their spiritual life and their spir-

itual liberty. There is much in common, in the spirit, the thoughts, and even the phraseology of this epistle, with that to the Ephesians, which was written and sent about the same time. Often abbreviated *Col.*

A solid body of greater length than thickness, standing upright, and generally serving as a support to something resting on its top; a pillar; more specifically, as an architectural term, a cylindrical or slightly tapering or fusiform body, called a *shaft*, set vertically on a stylobate, or on a congeries of moldings which forms its base, and surmounted by a spreading mass which forms its capital. Columns are distinguished by the names of the styles of architecture which they represent: thus, there are Egyptian, Grecian, Roman, and medieval columns. In classic architecture they are further distinguished by the names of the orders to which they belong, as Doric, Ionic, or Corinthian columns; and again, in various styles, by some peculiarity of position, of construction, of form, or of ornament, as attached, twisted, cabled or rufedated, and carolitic columns. Columns are used chiefly in the construction or adornment of buildings. They are also used singly, however, for various purposes: as, the *astronomical column*, from which astronomical observations are made; the *chronological column*, inscribed with a record of historical events; the *mnemonic column*, which supports a dial; the *itinerary column*, pointing out the various roads diverging from it; the *military column*, set up as a center from which to measure distances; the *triumphal column*, dedicated to the hero of a victory, etc.

In all common Orchids there is only one well-developed stamen, which is confluent with the pistil, and they form together the *column*. Darwin, *Fertil. of Orchids by Insects*, p. 3. 4. In *anat.* and *zool.*, a part or organ likened to a column or pillar; a *columna* or *columnella*: as, the *spinal column*; the *fleshy columns* of the heart.—5. In *Crinoidea*, specifically, the stalk or stem of a crinoid.—6. *Milit.*, a formation of troops narrow in front and extended from front to rear: thus distinguished from a *line*, which is extended in front and thin in depth. McPherson was in *column* on the road, the head close by, ready to come in wherever he could be of assistance. U. S. Grant, *Personal Memoirs*, 1. 524.

7. *Naut.*, a number of ships following one another.—8. In *printing*, one of the typographical divisions of printed matter in two or more vertical rows of lines. The separation of columns is made by a narrow blank space in which is sometimes placed a vertical line or rule. Division into columns economizes space, and saves the fatigue of the eye arising from attempts to trace the connection of an over-long line with the following line. Hence—9. The contents of or the matter printed in such a column, especially in a newspaper: as, the *columns* of the daily press.—10. An ap-

paratus used for the fixation of colors upon fabrics by means of steam. It consists of a cylinder of copper punctured with small holes and having a steam-pipe in its interior. The printed fabrics are wrapped around the cylinder, and the steam is allowed to percolate through, setting the colors in what is called steam style. The column is generally used in France, while the steam-chest serving for the same operation is used in England.

In a few *E.* words, as *comfit*, *comfort*, *discomfit*, *com-* (pron. and formerly written *cum-*, *ME. cun-*, *con-*) is changed from orig. *L. con-*. In many *E.* words derived through the *F.* the *L. com-* (*con-*, etc.) is concealed: see *coil* = *cull*, *cost*, *costive*, *costume* = *custom*, *couch*, *council*, *counsel*, *count*, *count*, *countenance*, *cover*, *cover*, *curfew*, *curry*, *kerchief*, etc. See *co-*, *col-*, *con-*, *cor-*, and also *contra-*, *counter*, *counter-*.] A prefix of Latin origin, appearing also in other forms, *co-*, *col-*, *con-*, *cor-*, meaning 'together,' 'with,' or merely intensive, and in English words often without assignable force. 3. The fleshy crest or caruncle growing, in one of several forms, on the head of the domestic fowl, and particularly developed in the male birds: so called from its serrated indentures

in the typical form, or single comb, which resemble the teeth of a comb. Several characteristic variations in the form of the comb have received distinctive names. An *antlered comb* is one having more or less the form of a stag's antlers, as seen in Polish and La Fliche fowls, often in Houdans, etc. The *leaf-comb* has much the form of a strawberry-leaf, set transversely on the head. It is the preferable form of comb in Houdan fowls. The *pea-comb* appears as if formed of three low, bluntly serrated combs set side by side on the head, the middle one of the three being the highest. It is the typical comb of the Brahma fowls. A *rose-comb* is a low comb set flat on the head, like a cap, broad in front, and tapering to a projecting spike behind, the upper part being evenly covered with small projections. It is best illustrated in the Hamburg fowls, and is also found in the Wyandotte, the Sebright bantam, and other varieties. The *strawberry-comb* resembles a half of a strawberry, generally somewhat wrinkled, and set well forward on the head. It is characteristic of the Malay and the Sumatra fowls.

The action of fire on inflammable materials; the act or process of burning. Chemically considered, combustion is a process of rapid oxidation caused by the chemical union of the oxygen of the air, which is the supporter of combustion, with any material which is capable of oxidation—that is, *combustible*. It results in the formation of oxygen compounds, some or all of which may be gaseous and therefore invisible, and in the liberation of energy, which is made evident by a rise of temperature and often by flame or incandescence. The weight of the products of combustion is always precisely equal to the sum of the weight of the burned substance and that of the oxygen used in the burning. The energy set free is also precisely the same as that which would be required to separate the oxygen again from its combinations. In common life oxygen is the sole supporter of combustion. In the laboratory iodine, chlorine, and some other substances also perform a similar office in certain cases. The term *combustion* has also been applied to slow processes of oxidation not attended by high temperature or evolution of light, such as the combustion in the body which keeps up the animal heat, and the slow decomposition of animal and vegetable matter in the air. See *cremation*.

The compression of air renders the *combustion* of gaseous matter less perfect, and . . . within certain limits at least, the more rarefied the atmosphere in which flame burns, the more complete its *combustion*.

E. Frankland, Exper. in Chem., p. 901.

Any chemical action whatsoever, if its energy rise sufficiently high, may produce the phenomenon of *combustion*, by heating the body to such an extent that it becomes luminous. *Foerster.*

2†. Tumult; violent agitation with hurry and noise; inflammatory excitement; confusion; uproar.

3. In *astron.*, the state of being *combust*.

Combustion.—The being within $8^{\circ} 30'$ of the \odot , which is said to burn up those planets near him, so that they lose their power. It is always an evil testimony.

W. Lilly, Intro. to Astrology, App., p. 339.

Spontaneous combustion, the ignition of a body by the internal development of heat without the action of an external agent. It not infrequently takes place in heaps of rags, wool, or cotton soaked with oil, and in masses of wet coal. In the first case it is caused by the rapid spontaneous oxidation of oil, which raises the temperature sufficiently to make it burst into flame; in the second case a

similar rapid oxidation of the sulphur of pyrites contained in coal causes an increase of heat sufficient finally to ignite the coal. See *flame*.

Sw. komet, < L. cometa, also comes, < Gr. κομήτης** (with or without *αστήρ*, star), a comet, lit. long-haired (so called from the appearance of its tail), < κομᾶν, wear long hair, < κόμη, hair: see *coma*².] 1. One of a class of celestial bodies which move about the sun in greatly elongated orbits, usually elliptical or parabolic. The typical comet, as it approaches the sun, has the appearance of a bright star-like point (the *nucleus*) surrounded by a mass of misty light (the *coma*), which is

Comet of Donati, October 3d, 1858.
(From "Annals of Harvard Observatory.")

extended away from the sun into a stream of light (the *tail*) reaching a length of from 2' to 90". Comets which follow a parabolic orbit appear but once, their orbit being infinite, and are called *parabolic comets*; those moving in ellipses return periodically, and are called *periodic comets*. The fact of the periodicity of some comets was first established by Halley with reference to the comet of 1682. The paths in which they move are not, like those of the planets, but are nearly in the same plane as the orbit of the earth, but are inclined to that orbit at all angles; and their motion along their paths, though generally direct, that is, in the same direction as that of the earth and the other planets, is sometimes retrograde. Some comets have no nucleus, and this is the case with every one while it is still very remote, when it appears as a mere nebulous patch. In this state it is called a *telescopic comet*. As it approaches the sun, the nucleus is gradually formed as a central but not sharply defined point of light; later, the tail, consisting of vaporous matter driven back by some repellent influence of the sun, often with enormous velocity, is formed; and lastly, if the comet is a bright one, a series of bright envelopes rise successively from the nucleus, each extending back into the tail, and gradually disappearing. The matter of which comets are composed is so transparent that the faintest stars are seen through them without the slightest diminution of their luster. Of their physical constitution little is definitely known. The most remarkable discovery of recent times regarding them is the identity of the course of some of them with the orbit of certain showers of shooting stars. This was first demonstrated by the Italian astronomer Schiaparelli, who proved the agreement between the orbit of the great comet of 1862 and that of the star-shower seen annually about August 1st-10th. Very remarkable comets appeared in 1456, 1680, 1811, 1841, 1858 (Donati's), 1861, and 1874. They have always been objects of superstitious fear. See *cut* under *envelop*.

Also called the *Hellenic dialect*, and distinguished on the one hand from pure Attic, which it approached more or less closely, and on the other from the Alexandrian and other local or Hellenistic dialects. The writings of Aristotle mark the transition from Attic to the *common* dialect, and Polybius is the earliest writer of note who employs it. Authors who exerted themselves to restore the *common* dialect as far as possible to the pure Attic standard are called *Atticists*. After the fourth century A. D. the *common* dialect changed gradually into Byzantine Greek.—*Common diligence*. See *diligence*.—*Common divisor*. See *divisor*.—*Common field*. (Generally in the plural.) The keeping of such a place is a criminal offense. In order to meet various devices to evade the letter of the law, the statutory definitions are usually minute, specifying a great variety of detail. The essential features of all or nearly all laws against common gaming-houses consist in the prohibition of maintaining a place of shelter in any degree accessible to the public, whether open to all who come or only to a select or favored few, as a place of resort for the purpose of gaming. See *gaming*.—*Common good*, in *Scots law*, in its widest sense, all the property of a corporation over which the magistrates have a power of administration solely for the behoof of the corporation.—*Common land*, loosely, land owned in severalty but used in *common*; more strictly, land owned by the community, and, not being appropriated for the time to cultivation by any individual, used as waste or open land for *common* pasturage. (b) More appropriately, the parts of the former system which do not rest for their authority on any subsisting express legislative act; the unwritten law. In this sense *common law* consists in those principles and rules which are gathered from the reports of adjudged cases, from the opinions of text-writers and commentators, and from popular usage and custom, in contradistinction to statute law. (c) More narrowly, that part of the system just defined which was recognized and administered by the king's justices, in contradistinction to the modifications introduced by the chancellors as rules of equity in restraint or enlargement of the customary and statutory law (see *equity*), and, in respect of procedure, in contradistinction to the code practice.—*Common-law procedure acts*, three English statutes of 1852, 1854, and 1860 which simplified the forms of process, pleading, and practice in the superior courts.—*Common long meter*, in *psalmody*, a six-lined stanza combining a *common-meter* stanza with half of a *long-meter* stanza:

The usual sign (A) for these rhythms is derived from the theory of medieval musicians that duple rhythm was imperfect, and so to be indicated by a half or broken circle (B). It is not the initial of the word "common," since originally triple rhythm was regarded as the standard or perfect rhythm. The sign A now usually signifies quadruple rhythm, four beats to the measure, while C signifies duple rhythm, two beats to the measure. Also called *common time*.—*Common meter*, in *psalmody*, a form of iambic stanza, primarily of 4 lines, having alternately 8 and 6 syllables to the line; so called because it was the commonest stanza in early psalmody. *Double common meter* consists of a stanza with 8 lines having alternately 8 and 6 syllables.—*Common multiple*. communism (kom'ū-nizm), *n.* [*F. communisme*, *commun*, *common*, + *-isme*: see *common*, *commune*², *n.*, and *-ism*.] 1. An economic system, or theory, which rests upon the total or partial abolition of the right of private property, actual ownership being ascribed to the community as a whole or to the state. The right of the state to control the means of production, and also the distribution and consumption of the products of industry, is in general especially emphasized by the advocates of the theory. In some communistic schemes the right of the individual to the control of his own labor is also denied, each one being required to do that which is most advantageous to the community as a whole. Such theories, differing in details, have frequently been advanced—by Plato in his "Republic," by Sir Thomas More in his "Utopia," and in recent times by many writers—and have not infrequently been carried into execution on a small scale, as in the Oneida Community. See *community*.

Communism, in its ordinary signification, is a system or form of common life in which the right of private or family property is abolished by law, mutual consent, or vow. To this community of goods may be added the disappearance of family life.

Woolsey, *Communism and Socialism*, p. 1.

Communism is the name that has been given to the schemes of social innovation which have for their starting-point the attempted overthrow of the institution of private property.

One who advocates and practises the doctrines of communism.

All communists without exception propose that the people as a whole, or some particular division of the people, as a village, or commune, should own all the means of production—land, houses, factories, railroads, canals, etc.; that production should be carried on in common; and that officers, selected in one way or another, should distribute among the inhabitants the fruits of their labor.

R. T. Ely, *French and German Socialism*, p. 35.

Discordant theories range from the doctrines of the *communist*, who would overturn our social structures, to those of the timid, half-hearted believers in our government, who wish to go back to restraints and powers exerted by the monarchs of Europe.

W. E. Hearn, *Aryan Household*, p. 240.

Noyes, after unsuccessful attempts to establish it at New Haven, Connecticut, in 1834, and at Putney, Vermont, in 1837. A branch of the Oneida Community also existed at Wallingford, Connecticut, but has now been withdrawn. Originally the Oneida Community was strictly communistic, all property and all children belonging primarily to the society, and the restrictions of marriage being entirely abolished; but in 1879, owing to the increasing demand of public opinion that the social practices of the society should be abandoned, marriage and family life were introduced, and in 1880 communism of property gave place to a joint-stock system, and the Community was legally incorporated as "the Oneida Community, Limited."—*Village community*, an early form of organization, in which the land belonged to the village, the arable land being allotted by it to the members or households of the community, by more or less permanent arrangements, the waste or common land remaining undivided.

The usual optical comparator has two microscopes, firmly attached to a bar or something of that sort, with their focal planes coincident and furnished with flar micrometers, whose screws lie virtually in one right line. There is also a carriage moving at right angles to the screws, so as to bring first one bar and then another under the microscopes. In Saxton's comparator a beam of light is caused to fall on a mirror delicately supported on its axis, round which a very fine chain is wound, the other end being attached to a lever provided with a spring in such a way that the mirror is turned one way or the other as the bar contracts or expands, or is replaced by a shorter or longer bar. The mirror throws the beam upon a large scale at some distance, where it indicates by a large movement the very minute movements of the mirror. One form of color-comparator employs a glass prism, which may be filled with a colored liquid, and a series of glass tubes containing colored solutions of known tints and shades.

Adjectives not admitting this variation, and many adverbs, express like degrees by prefixing the comparative adverbs *more* and *most*: as, *more glorious, most glorious; more weakly, most weakly*; and such phrases often receive, less properly, the same names as the forms of equivalent value.

7. An instrument used to indicate the magnetic meridian, or the direction of objects with reference to that meridian. The mariners' or ship's compass consists of three parts, viz., the *bowl*, the *card*, and the *needle*. The bowl, which contains the card and needle, is usually a hemispherical brass receptacle, suspended by two concentric brass rings (called *gimbals*) in such a manner that the bowl is kept in a horizontal position, notwithstanding the motion of the ship. The circular card is divided into 32 equal parts by lines drawn from the center to the circumference, the points of intersection with the circumference (or the radial lines, or *rhumbs*, themselves) being called the *points of the compass*. The intervals between the points are also divided into halves and quarters. The whole circumference is divided into 360 degrees; consequently, the angle between any two adjoining points is 11° 15'. The four principal divisions (dividing the circumference into four equal parts) are called the *cardinal points*, viz., north, east, south, and west. The names of the others are compounded of these; and if the direction or bearing referred to lies between any two points, quarter or half points are added, as N. E. by E. $\frac{1}{4}$ E.; or it is expressed in degrees, as south 42° west. The needles, of which there are generally from two to four, fastened to the bottom of the card, consist either of laminae or layers of hardened steel or of bundles of steel wire. In the center of the card is a conical socket poised on an upright pin fixed in the bottom of the bowl, so that the card hanging on the pin turns freely round its center. On ship-board the compass is so fixed that a black mark, called the lubber's line, coincides with an imaginary line parallel to the keel of the ship, and the point of the compass-card which is directly against this line indicates the direction of the ship's head. The indication is, however, subject to a certain modification, owing to the variation of the magnetic meridian (see *variation*) and the deviation of the needle caused by the iron in the ship (see *deviation of the compass, under deviation*). The regulation compass in the United States navy, and the one also used on many mail-steamers, is known as *Ritchie's liquid compass*, in which the card is a skeleton, and the bowl, having a glass top, after being filled with a fluid composed of about one third alcohol and two thirds water, is hermetically sealed.

composing-machine (kəm-pō'zing-mā-shēn'), *n.* A type-setting machine. The earliest composing-machine, invented by William Church in 1821, attempted to make the types as well as set them. This special and instantaneous making of the types is also the basis of more recent inventions; but most composing-machines are constructed to set types previously made. The types are specially grooved or nicked to fit them for being seized automatically. The arrangement of classified types in separate channels, and their dislodgment in order into a larger channel by means of levers touched from a finger-board, are features common to most composing-machines, widely as they may differ in other details of construction. Few of these machines have come into practical use, owing especially to the difficulty of separating or distributing the types by an automatic process in the special manner required. See *linotype*.

composing-stand (kəm-pō'zing-stand), *n.* In *printing*, an elevated framework, usually of wood, on which the type-cases are placed in inclined positions, the part for the upper case having a steeper slope than that for the lower. Also called *composing-frame*, or in common use *frame* or *stand*.

Composing-stick.

and arranges the types that he picks out of the cases with his right hand. The composing-stick is fitted with a knee, adjustable, by means of a screw or a clamp, to any length of line required in printed work. The earliest composing-sticks were sticks of wood, with knees specially tacked on for different lengths of line; but wooden sticks are now used only in setting hand-bills, or for other work requiring very long lines.

Compositæ¹ (kom-poz'i-tê), *n. pl.* [NL., fem. pl. (se. *L. plantæ*, plants) of *L. compositus*, composite; see *compositæ*.] The largest natural order of plants, including over 750 genera and 10,000 species, distributed all over the globe wherever vegetation is found, and divided equally between the old world and the new. They form about a tenth of all phenogamous plants, an eighth of those of North America, and in some regions even a larger proportion. They are herbs, or much more rarely shrubs, scarcely ever arborescent, and are of comparatively slight economic importance. A few species are cultivated for food, as the artichoke (*Cynara*), the salsify (*Tragopogon*), and the lettuce (*Lactuca*); others have useful medicinal properties; and a very large number are cultivated for ornament. The flowers are gamopetalous and mostly pentamerous, sessile in a close head (the compound flower of early botanists, whence the name of the order), and surrounded by an involucre of separate or connate bracts. The ovary is inferior and one-celled, and becomes an achene in fruit, the calyx-lobes being reduced to a circle of hairs, awns, scales, or teeth, called the *pappus*. The stamens are inserted on the corolla, and their anthers are united into a tube, on which account the name *Synanthereæ* has been sometimes given to the order. The genera of the order are divided into three series, depending upon the character of the corolla, viz.: (1) the *Labiataefloræ* (or *Mutisiaceæ*, of 59 genera, largely South American), having a bilabiate corolla, at least in the perfect flowers; (2) the *Ligulifloræ* (or *Cichoriaceæ*, of 56 genera, mostly of the old world, in which the corollas are all ligulate (strap-shaped); and (3) the *Tubulifloræ*, having regular tubular corollas in all the perfect flowers. The last series is again divided into 11 tribes. The 10 largest genera of the order, including three tenths of the species, are *Senecio* (840 species, largely of South America and southern Africa), *Eupatorium* (430 species, all American), *Vernonia* (375 species, mostly tropical), *Centaurea* (316 species, of the Mediterranean-Persian region), *Baccharis* (250 species, mostly South American), *Helichrysum* (235 species, of southern Africa and Australia), *Aster* (174 species, largely North American), *Cnicus* (165 species, of the Mediterranean-Persian region and North America), *Artemisia* (152 species, of Europe, Asia, and North America), and *Hieracium* (150 species, of Europe, Asia, and North America). By far the largest North American genus is *Aster* (124 species), followed by *Solidago* (78), *Erigeron* (71), *Senecio* (57), *Aptropappus* (45), *Artemisia* (42), *Helianthus* (42), *Eupatorium* (39), *Cnicus* (37), *Bignelovia* (31), and *Brickellia* (31); these genera include two fifths of the species of North America. Also called *Asteraceæ*.

All bodies probably are compressible in a greater or less degree. Those bodies which return to their former shape and dimensions when the compressing force is removed are said to be *elastic*. conaria, *n.* Plural of *conarium*.

conarial (kō-nā'ri-āl), *a.* [< *conarium* + *-al*.] Of or pertaining to the conarium, or pineal body of the brain.

Conarial fossa, a depression of the roof of the skull of some animals, in which the conarium is lodged.—**Conarial tube**, the more or less extended cavity or canal of the pineal body, now commonly supposed to be the remnant of the passage by which in vertebrates generally the primitive cavity of the myelencephalon communicated with the outer surface of the head. In man and the higher vertebrates generally the conarium appears to be deep-seated in the brain; but this is deceptive, and is merely owing to the overgrowth of the cerebrum. The conarium is morphologically on the superior surface of the brain, whatever its apparent situation, and there is much reason to suppose that the large openings of the top of the skull in aundry Tertiary mammals, called the parietal foramina, indicate the extension of the conarial tube to the surface, and the formation there of a visual or other special-sense organ. On this view, the conarium is the vestige of an extinct eye. See *conarium*.

conario-hypophysial (kō-nā'ri-ō-hi-pō-fiz'-i-āl), *a.* [< *conarium* + *hypophysis* + *-al*.] In anat., pertaining to the conarium and to the hypophysis of the cerebrum, or to the pineal and pituitary bodies. It is a small reddish body developed from the hinder part of the roof of the first cerebral vesicle, and lying in front of and above the nates. Its substance consists mainly of epithelial follicles and connective tissue; there is no evidence that it is a nervous structure, and its function, if it possess any, is unknown. It was formerly supposed by some (as by the Cartesians) to be the seat of the soul. See *conarial*, and cuts under *corpus* and *encephalon*.

When we do our utmost to conceive the existence of external bodies, we are all the while only contemplating our own ideas. But the mind, taking no notice of itself, is deluded to think it can and doth conceive bodies existing unthought-of or without the mind; though at the same time they are apprehended by or exist in itself. Bp. Berkeley, Human Knowledge, § 23.

To conceive a round square, or to conceive a body all black and yet all white, would only be to conceive two different sensations as produced in us simultaneously by the same object. a conception familiar to our experience; and we should probably be as well able to conceive a round square as a hard square, or a heavy square, if it were not that, in our ordinary experience, at the instant when a thing begins to be round it ceases to be square, so that the beginning of the one impression is inseparably associated with the departure or cessation of the other. J. S. Mill.

We cannot conceive an individual without in the same act implying a class to which it belongs, and a larger class from which it is distinguished. G. H. Leves, Probs. of Life and Mind, II. ii. § 14.

All thought is a comparison, a recognition of similarity or difference; a conjunction or disjunction . . . of its objects. In *Conception*, that is, in the forming of concepts (or general notions), it compares, disjoins, or conjoins attributes. Sir W. Hamilton, *Logic*, I.

Conception means both the act of conceiving and the object conceived. . . . Now this is a source of great vagueness in our philosophical discussions. . . . For the act of conceiving, the term *Conception* should be employed, and that exclusively. Sir W. Hamilton, *Logic*, iii.

Conception we regard equally as an occurrence in consciousness; and, though we suppose it to take place in the absence of any object at the time affecting the senses, we practically separate in our thoughts the conceived content or object from the *conception*, and imagine it vaguely as residing elsewhere than in consciousness. T. H. Green, *Prolegomena to Ethics*, § 58.

conceptualism (kən-sep'tū-əl-izm), *n.* [= *F. conceptualisme* = *Sp. Pg. conceptualismo*, *< NL. *conceptualismus*, *< *conceptualis*: see *conceptual* and *-ism*.] The psychological doctrine that the meaning of a general class-name, as *horse*, *red*, etc., can be fully represented in thought or be actually present to consciousness: opposed both to *realism* and to *nominalism*. It is mainly an English doctrine, and Locke is the most celebrated advocate of the opinion. The term is also applied to some of the opinions concerning universals held in the middle ages, under the impression that the questions then at issue were the same as that discussed by the English philosophers.

Dr. Brown repudiates the doctrine of *conceptualism* as held by Locke and others. He admits that we can represent to ourselves no general notion of the common attribute or attribute which constitute a class; but he asserts that the generality, which cannot be realized in a notion of the resembling attribute, is realized in a notion of the resemblance itself.

Sir W. Hamilton, *Metaph.*, xxxvi.

= Syn. *Conclise*, *Succinct*, *Condensed*, *Laconic*, *Summary*, *Conspicuous*, short, terse, pithy, sententious, compact. The first four imply fullness of meaning as well as great brevity; the next two that the subject is treated by exhibiting only its main heads, and that therefore the treatment is comparatively brief. *Conclise* frequently refers to style, and signifies the expression of much in few words; *succinct* is generally applied to the matter, the less important things being omitted: thus, a *conclise* style or phrase, but a *succinct* orative or account. *Condensed* relates more to the mode of treatment by which a matter is brought or compressed into a smaller space than it might have occupied. *Laconic* is applied to expressions which carry condensation or brevity to an extreme. A *summary* account gives the principal points in the case; a *compendious* account is more sure than a *summary* account to give a complete and sufficient view of the subject.

(See *triad*, and *common chord*, under *chord*, 4.) *Concords* of two tones are acoustically distinguished from *discords* by the simplicity of the ratios between the vibration-numbers of the tones: thus, the ratios of the above concords are 1, 2, 3, 4; 2, 3, 4, 5; and 3, 4, 5, 6 respectively.
